NEW RECORDS TO THE VASCULAR FLORA OF KAZAKHSTAN (CENTRAL ASIA)

ALEKSANDR L. EBEL, ANDREY N. KUPRIYANOV, IRINA A. KHRUSTALEVA, ANDREY I. PYAK, POLINA D. GUDKOVA & MARCIN NOBIS

Abstract. The paper presents distributional data for seven species new for the flora of Kazakhstan: Atriplex gardneri var. aperta (A. Nelson) S. L. Welsh & Crompton, Cardamine hirsuta L., Carduus acanthoides L., Galega orientalis Lam., Silene cserei Baumg., Didymophysa fedtschenkoana Regel and Acinos arvensis (Lam.) Dandy. Didymophysa fedtschenkoana is a native element in the Kazakh flora; the other species should be treated as alien, expansively spreading or invasive in this part of Asia. A list of localities of the species in Kazakhstan and their habitat preferences are presented.

Key words: alien plants, Central Asia, distribution, native plants, taxonomy

INTRODUCTION

Kazakhstan is one of the largest Eurasian countries. With an area of 2.725 million km², it is the world’s ninth-largest country. According to a nine-volume study of the flora of Kazakhstan, completed by a large team of authors (Pavlov 1956–1966) and supplemented by the work of other researchers (e.g., Karamysheva & Rachkovskaya 1973; Abdulina 1999; Baitenov 2001), ca 6000 vascular plant species are known from the country. This number is not final, as new species have been described recently from Kazakhstan (e.g., Sytin 2000; Kotukhov 2003; Nobis 2010, 2013; Perezhogin 2013; Pimenov & Kljuykov 2014), and new records for its flora have been published (e.g., Kotukhov 2002; Suchorukow 2003; German 2006; Nobis et al. 2014). In this paper we present seven vascular plant species new for the country.

MATERIAL AND METHODS

Specimens were collected mostly between 2006 and 2014 in many different localities in following regions of Kazakhstan: the Kazakh Melkosopochnik, Kokshetau Upland, Altai Mts (Kazakhstan Altai), Western Tian-Shan Mts, and Trans-Ili Alatau range in North Tian-Shan. Herbarium materials of the newly discovered species were revised in AA, ALTB, KUZ, NS and TK. Plant material of the taxa listed below is deposited in KUZ and TK.
RESULTS AND DISCUSSION

Acinos arvensis (Lam.) Dandy (Lamiaceae)

General distribution. Acinos arvensis is distributed in Europe and Western Asia (Hultén & Fries 1986). It is known as an alien plant from Siberia and the Far East (Probatova 1995; Doronkin 1997, 2012; Ebel 2012). In Altaysky Krai the species was recorded at the beginning of the 20th century (Krylov 1937), and nowadays it is treated as an invasive plant.

Occurrence in Kazakhstan. Acinos arvensis is an alien species new for the flora of Kazakhstan. It was found on a slightly eroded slope on the edge of a meadow near a river. There were ca 30 blooming plants in that population. It is difficult to estimate the current invasive status of Acinos arvensis in Kazakhstan because of the lack of long-term observations. Following Pyšek et al. (2004) it can be classed as ‘not harmful’.

Specimens seen: Kazakh Melkosopochnik. Akmolinsk Region, Ereymentau district, surroundings of Karatal village, Ereymentau Mts (southern part), edge of meadow near river, 51°03′20″N, 73°03′28″E, 28 June 2014, A.L. Ebel (TK).

Atriplex gardneri var. aptera (A. Nelson) S. L. Welsh. & Crompton (Chenopodiaceae)

Atriplex aptera A. Nelson

General distribution. Atriplex gardneri is native to western North America (Reed 1993). It occurs commonly in fine-textured saline substrates in much of the western Great Plains and in the Intermountain Region. No information about previous records of this species as an alien plant in Eurasia was found (Zhu et al. 2003; Suchorukov 2007; Uotila 2011).

Atriplex gardneri is currently considered to be a complex of several varieties. The varieties show different ploidy levels, with diploid, triploid, tetraploid, hexaploid and other levels known (Welsh 2003). Diploid and polyploid individuals may occupy different types of habitat (Reed 1993).

Occurrence in Kazakhstan. Atriplex gardneri is an alien species new for the flora of Kazakhstan. In 1995, seeds of the species together with 24 other taxa were planted for recultivation purposes on dumps of the Ekibastuzsky coal field. During research in 2006 we confirmed that A. gardneri was established and was spreading in this region. This alien plant has sustained a self-replacing population for more than 10 years, and according to Pyšek et al. (2004) it can be classed as ‘not harmful’.

Cardamine hirsuta L. (Brassicaceae)

General distribution. The species is widespread in Europe and Southwest Asia and was introduced into Southern Africa, Australia, and North and South America (Hultén & Fries 1986). In many regions the plant is introduced unintentionally in the soil of plants brought from garden centers. It grows best in consistently damp, recently disturbed soils.

Occurrence in Kazakhstan. Cardamine hirsuta is an alien species new for the flora of Kazakhstan. It grows in disturbed soils along paths and in pots with ornamental plants in a garden near Almaty. According to oral information from Vladimir Epiktetov (Almaty), this species appeared first in a nursery in the garden in 2010. Following Pyšek et al. (2004), it can be classed as a ‘weed’.

Specimens seen. Northern Tien-Shan. Along paths and in pots with ornamental plants in a garden, ca. 6 km SW of Zhanaturmys village (15 km SW of Almati), 8 June 2013, A.L. Ebel (TK); the same location, 43°07′33″N, 76°45′08″E, 17 May 2014, M. Nobis & P.D. Gudkova (observation).

Carduus acanthoides L. (Asteraceae)

General distribution. The species is widespread in Southern Europe and in Asia Minor. In Russia it occurs in the European part, in the Caucasus, and in the Upper Tobolsk region of Western Siberia (Tamamshyan 1963; Tzvelev 2000), Perm Territory (Ovesnov 2007), Chelyabinsk Region (Kulikov 2010) and the Russian Far East (Barkalov...
1992). Currently the species is relatively widespread in forest-steppe areas of Siberia, from the Kurgan Region and Omsk Region in the west to low-mountain regions of the Russian Altai and Kuzbass in the east (Naumenko 2008; Ebel et al. 2009; Ebel 2012). In Siberia the species occurs sporadically on roadsides and railway areas, on intensively used pastures, and in settlements. As an alien plant it was recorded also in China (Shi & Greuter 2011), Kyrgyzstan (Laz’kov et al. 2011) and Tajikistan (Nobis et al. unpubl.).

Occurrence in Kazakhstan. Carduus acanthoides is an alien (probably spreading) species new for Kazakhstan. It grows in anthropogenic habitats and is recorded mostly on roadsides and footpaths in towns. Following Pyšek et al. (2004) it can be classed as ‘not harmful’.

Didymophysa fedtschenkoana Regel (Brassicaceae)

General distribution. The species is widespread in western Tien-Shan and in the Pamir Alai Mts. It occurs in Afghanistan, Kyrgyzstan, Pakistan, Tajikistan and Uzbekistan (Jafri 1973; Vinogradova 1974) in the upper mountain belt on scree, rocks and glacial moraines.

Occurrence in Kazakhstan. Didymophysa fedtschenkoana is a native species new for the flora of Kazakhstan. The new record is one of the northernmost locations of the species within its natural distribution range. Its occurrence in other similar habitats in remote and poorly investigated regions of Western Tien-Shan within Kazakhstan is highly probable.

Galega orientalis Lam. (Fabaceae)

General distribution. The species is widespread in the Caucasus, where it grows in forests, scrub and meadows (Gorshkova 1945). In the territory of Russia the plant is cultivated as an ornamental and for fodder. It has become a wild-growing plant and has rapidly entered the forest-steppe zone of Eurasia (Majorov et al. 2012). The species was also recorded as an alien plant in the Leningrad Region (Tzvelev 2000), in the territory of Perm (Ovesnov 2007), in the Chelyabinsk Region (Kulikov 2010) and in Western Siberia (Pyak et al. 2000; Naumenko 2008; Ebel 2012; Silantyeva 2013). Outside its natural area it grows also on the outskirts of cultivated fields and on roadsides.

Occurrence in Kazakhstan. Galega orientalis is an alien species new for the flora of Kazakhstan. It was found in young forest in a dried channel between lakes. Following Pyšek et al. (2004) it can be classed as ‘not harmful’.

Silene cserei Baumg. (Caryophyllaceae)

Oberna cserei (Baumg.) Ikonon.; Oberna schottiana (Schur) Tzvel.

General distribution. The species is widespread in Southeastern Europe, Asia Minor and the Caucasus (Marhold 2011; Laz’kov 2012). It was recorded as an alien plant in Finland (Marhold 2011), in some places in European Russia (Tzvelev 2004) and in the Ural Mts (Chelyabinsk Region in the Boundary-Kazakhstan steppe), where it occurs on grassy dumps of gravel and also on disturbed stony slopes (Kulikov 2010). The species is also recorded as an alien plant in many states of the USA and provinces of Canada (Morton 2005).

Occurrence in Kazakhstan. Silene cserei is an alien species new for the flora of Kazakhstan. It grows in anthropogenic habitats on disturbed soils. Following Pyšek et al. (2004) it should be classed as ‘not harmful’.

Acknowledgements. We are grateful to the curators of AA, TK and KUZ for making their collections available for study, and to the anonymous reviewers for valuable remarks and suggestions on the manuscript. The field work of A. Ebel, A. Kupriyanov and I. Khustaleva was supported in part by the Ministry of Education and Science of the Republic of Kazakhstan (grant no. 0112 PK 00405). The research of A. Ebel, A. Kupriyanov and I. Khrustaleva was supported in part by the Ministry of Education and Science of the Republic of Kazakhstan (grant no. 0112 PK 00405). The research of M. Nobis was funded in part by the National Science Centre, Poland, decision no. UMO-2013/09/B/NZ8/03287.
