

CALAMAGROSTIS (POACEAE, AGROSTIDINAE) IN VIETNAM

BEATA PASZKO¹, BING LIU & HAI-YING MA

Abstract. New taxonomic and distributional data are provided for three eastern Asian species of *Calamagrostis* (Poaceae, Agrostidinae) in Vietnam: *C. abnormis* (Hook. f.) Shukla, *C. extremiorientalis* (Tzvel.) Prob. and *C. tripilifera* Hook. f. The new national record of *C. extremiorientalis* is reported here for Vietnam, where it was previously misidentified as *C. elatior* (Griseb.) A. Camus or *Deyeuxia petelotii* Hitchc. (= *C. abnormis*). The presence of *C. tripilifera* and *C. abnormis* in Vietnam is confirmed. Additional new provincial records of *C. extremiorientalis* from Japan's Bonin Islands (also known as the Ogasawara Islands) and *C. tripilifera* from Daba Mountains in the northern Chongqing Municipality (Central China) are reported here. A key for identification of *Calamagrostis* species in Vietnam, nomenclatural data and information about geographical, altitudinal and habitat distributions are provided. Maps showing their complete distribution in eastern Asia are presented.

Key words: *Agrostis*, *Asia*, *Deyeuxia*, distribution, Eastern Asian region, nomenclature, taxonomy

INTRODUCTION

Recent molecular study of ribosomal and plastid DNA sequences indicates that *Deyeuxia* Clarion ex P. Beauv. is a synonym of *Calamagrostis* Adans. (Poaceae, Agrostidinae), and that many Eurasian species that have been variously treated in these genera are closely related (Saarela *et al.* 2010; J. M. Saarela, unpubl. data). In view of this, Paszko (2015, 2016) and Paszko *et al.* (2016a, b) have applied a more broadly defined concept of the genus *Calamagrostis*, including Asian species of *Deyeuxia*, in an ongoing project to compile a new treatment of *Calamagrostis* for *Flora of Pan-Himalaya* and *Flora of Nepal* in accordance with the molecular evidence.

Describing the geographical distribution of a species depends on correct identification of specimens. Unfortunately, misidentification of specimens at species level is frequent in herbarium materials and in the literature, particularly in difficult groups like grasses. The first author and her collaborators

revealed several such cases in *Calamagrostis* and *Deyeuxia* (Paszko & Ma 2011; Paszko 2014, 2015; Paszko & Soreng 2013; Paszko *et al.* 2013, 2016a, b) as well as in *Agrostis* (Nobis *et al.* 2016; Paszko & Liu 2016).

The aim of this study is to revise and update the nomenclature, taxonomy and geographical distribution of the *Calamagrostis* species occurring in Vietnam. Two species of the genus *Calamagrostis*, *C. elatior* (Griseb.) A. Camus and *C. tripilifera* Hook. f., were recorded from Indochina (comprising Vietnam, Laos and Cambodia) by Camus (1928) and later by Schmid (1958). Schmid (1958) added *Aulacolepis petelotii* Hitchc., *nom. inval.* [= *C. abnormis* (Hook. f. *emend.* Paszko) Shukla]. Vietnamese records of the *Calamagrostis* species are based on Petelot's gatherings, housed in herbarium P and possibly elsewhere. All of them were collected by Petelot in northwestern Vietnam in the area of the Hoan Lien Mts, which extend south from the Ailao Shan Mts in China, the southeasternmost extension of the Himalayan chain.

¹ Corresponding author

In *Checklist of Plant Species in Vietnam*, Khoi and Đô (2005) recorded three species of *Agrostis* (*A. micrantha* Steud., *A. stolonifera* L., *A. triaristata* Knapp), one species of *Calamagrostis* [*C. elatior* (Hook. f.) A. Camus; incorrect citation of basionym author] and one species of *Deyeuxia* [*D. petelotii* (Hitchc.) S. M. Phillips & W. L. Chen]. They placed *Calamagrostis tripilifera* Hook. f. in synonymy of *Agrostis triaristata*. Recently, Tran and Vu (2013) made a revision of species within the tribe Aveneae (Poaceae) for the flora of Vietnam. They followed Khoi and Đô's (2005) treatment, with one exception. Tran and Vu (2013) referred to *D. petelotii* specimens identified by Camus (1928) and Khoi and Đô (2005) as *C. elatior*.

In the course of revision of species of *Calamagrostis* and *Agrostis* in Vietnam, we found that Khoi and Đô (2005) and Tran and Vu (2013) invalidly applied Knapp's name *A. triaristata*, a species described from Europe, for specimens earlier identified by Camus (1928) and Schmid (1958) as *Calamagrostis tripilifera*. Khoi and Đô (2005) also incorrectly cited the basionym author for the name *Calamagrostis elatior*, as noted by Tran and Vu (2013); the correct authorship for this combination is *C. elatior* (Griseb.) A. Camus.

In the present paper, the misidentified species previously reported as *C. elatior* (Camus 1928; Schmid 1958; Khoi & Đô 2005) is correctly named *C. extremiorientalis* (Tzvel.) Prob. We also confirmed the identification of Vietnamese *C. tripilifera* made by Camus (1928). The study of the overall distribution of these three Vietnamese species of *Calamagrostis* revealed the first record of *C. tripilifera* from the Daba Mts in northern Chongqing Municipality in southwest China, and the first record of *C. extremiorientalis* from Japan's Bonin Islands (also known as the Ogasawara Islands).

MATERIAL AND METHODS

We studied specimens of *Calamagrostis abnormis*, *C. extremiorientalis* and *C. tripilifera* from the following herbaria: BM, CAS, CDBI, E, GH, K, KRAM, KUN, L, LE, NEFI, P, PE, S, TI, US and W (Thiers 2016). All revised localities of *Calamagrostis abnormis*, *C. extremiorientalis* and *C. tripilifera* are cited. The overall

geographical ranges of species are shown on dot maps (Figs 1–3) produced using SimpleMappr (<http://www.simplemappr.net/>). Geographic coordinates were acquired using Google Earth (<http://www.google.com/earth/download/ge/>), Google Maps (www.google.com/maps) and topographic maps (Vlasenko 2008). If this information was not part of the original collection data, estimated coordinates are given in square brackets. To compare some historical localities of H. Handel-Mazzetti, J. D. Hooker and F. Kingdon-Ward with current geographic locations, we used their recollections (Hooker 1854; Handel-Mazzetti 1996; Kingdon-Ward 1936, 1940) and letters (Hooker 1847–1851). Other resources for place and geographical feature names were the maps compiled by Gören Herner of the routes of the Swedish botanist Karl August Harald (Harry) Smith (Herner 1988). Because all three species have complicated nomenclature, we provide complete synonymy. Diagnostic characteristics for species studied are given in Table 1.

KEY TO THE SPECIES OF *CALAMAGROSTIS* IN VIETNAM

1. Callus hairs longer than lemma, $1.26\text{--}2.25 \times$ length of lemma; lemmas $0.39\text{--}0.61 \times$ length of lower glumes; rachilla prolongations frequently absent, sometimes present in the form of naked rachis
..... 2. *C. extremiorientalis*
- 1*. Callus hairs not more than $1/2$ as long as lemma, $0.2\text{--}0.5 \times$ length of lemma; lemmas $0.60\text{--}1.03 \times$ length of lower glumes; hairy rachilla prolongations always present 2
2. Lower glumes $1.9\text{--}2.6$ mm long; lemmas $1.85\text{--}2.50$ mm long; lemmas awnless or with short mucro, $0.15\text{--}0.33$ mm long, inserted subapically; lack of lateral mucros on lemmas 1. *C. abnormis*
- 2*. Lower glumes $3.05\text{--}7.10$ mm long; lemmas $2.65\text{--}5.50$ mm long; lemmas always with well developed geniculate awn, $3.9\text{--}9.2$ mm long, inserted at lower part of lemma; lateral mucros on lemmas almost always present, $0.20\text{--}0.85$ mm long 3. *C. tripilifera*

TAXONOMIC TREATMENT

1. *Calamagrostis abnormis* (Hook. f.) Shukla

Grasses of North-Eastern India: 45. 1996.

BASIONYM: *Deyeuxia abnormis* Hook. f., Fl. Brit. India 7(22): 268. 1896, s.str. emend. Paszko (in Paszko & Soreng, Phytotaxa 111(1): 6. 2013). LECTOTYPE

Table 1. Diagnostic characters for *Calamagrostis abnormis* (Hook. f.) Shukla, *C. extremitorientalis* (Tzvel.) Prob. and *C. tripilifera* Hook. f. The number of specimens examined is given in brackets below the species name.

Species / Character	<i>C. abnormis</i> (33)	<i>C. extremitorientalis</i> (120)	<i>C. tripilifera</i> (82)
Lower glume length (LGL) [mm]	1.90–2.55	4.25–7.65	3.05–7.10
Lower glume width (LGW) [mm]	0.50–0.95	0.65–1.10	1.15–2.75
Upper glume length [mm]	1.90–2.63	4.05–6.95	2.75–6.40
Upper glume width [mm]	0.55–0.88	0.6–1.1	0.8–1.8
Callus hair length (CHL) [mm]	0.6–1.0	3.75–5.85	0.65–1.75

A reliable description of *Deyeuxia abnormis* Hook. f. *s.str. emend.* Paszko was provided by Paszko and Soreng (2013). Schmid (1958) considered in the genus *Aulacolepis* Hack., *nom. illeg. hom.*, a new species, *Aulacolepis petelotii* Hitchc., *nom. inval.*, which should be treated within the genus *Calamagrostis*, as *C. abnormis* (Hook. f.) Shukla, based on *Deyeuxia abnormis* Hook. f. *emend.* Paszko (in Paszko & Soreng 2013). *Aulacolepis petelotii* was described by Hitchcock (1934: 291) based on Pételet's collection from Fan Si Pan (Fansipan) Mt., the highest point in Indochina (3,143 m). Mount Fan Si Pan is situated on the border between Lai Chau and Lao Cai Provinces, 9 km southwest of Sa Pa, a Vietnamese mountain health resort.

Paszko and Soreng (2013) amended the diagnosis and description of Hooker's *Deyeuxia abnormis*, rejected Noltie's (1999) relectotypification of *D. abnormis*, reverting to Bor's (1954: 442) original designation, and showed taxonomic relationships between *D. abnormis* and its allies. Currently, we treat it under the genus *Calamagrostis* in accordance with the molecular evidence (Saarela *et al.* 2010; J. M. Saarela, unpubl. data).

HABITAT AND PHENOLOGY. A perennial densely tufted grass that grows in open primary, humid, broadleaved and mixed evergreen forests (with *Alnus nepalensis* D. Don, *Quercus semecarpifolia* Sm., *Pinus wallichiana* A. B. Jacks., *P. yunnanensis* Franch.), grasslands, meadows, pastures and roadsides. 1200–3200 m. Flowers in July–September.

GENERAL DISTRIBUTION. Bhutan (Deothang, Thimphu, Punakha, Tongsa, Bumthang, Mongar and Tashigang Districts), China (W Guizhou and Yunnan Provinces), India [Arunachal Pradesh (currently under Indian administration, claimed by China as Zangnan, a region of Xizang Province), Manipur and Meghalaya Provinces], Nepal (Dolkha, Ramechhap, Sankhuwasabha and Solu

Khumbu Districts) and northwest Vietnam (Lao Kay Province) (Fig. 1).

NOTES. The hitherto known geographical range of *C. abnormis* extends from central and eastern Nepal through most of the Eastern Himalayas in Bhutan and India (Arunachal Pradesh), through south central China (W Guizhou, Yunnan), extending into northwest Vietnam and into the northeastern Indian hill states in Manipur (Manipur Hills) and Meghalaya (Khasi Hills) (Noltie 1999, 2000; Paszko & Soreng 2013). In China it is distributed mainly on the Yunnan-Guizhou Plateau, with some adjacent localities in the southeastern part of the Qinghai-Tibetan Plateau. In Vietnam it is recorded only from Mount Fan Si Pan (Handel-Mazzetti 1936, Schmid 1958). The gap between the localities at Manipur (NE India) and Yongde Co. (Yunnan, China) extends for 500 km. The disjunct distribution records of this species may be due to lack of field work in areas on the southern slopes and the western part of the eastern slopes of the Himalayas, or the disjunct distribution pattern may be real.

SPECIMENS EXAMINED: BHUTAN. BUMTHANG DISTR.: Batpalathang, E side of river opposite Jakar, pasture, alt. 2650 m, 27.567°N, 90.75°E, 17 Sept. 1998, Noltie *et al.* 232A (E); Kiki (Kyi Kyi) La, 9 km S of Jakar, among scrub in open *Pinus wallichiana* forest, alt. 2860 m, 27.533°N, 90.733°E, 5 Sept. 1998, Noltie *et al.* 86 (E); Beside Dhur Chu, Thangbi, edge of *Pinus wallichiana* forest, alt. 2700 m, 27.617°N, 90.717°E, 17 Sept. 1998, Noltie *et al.* 237 (E). 2. *Calamagrostis extremiorientalis* (Tzvel.) Prob.
Sosud. Rast. Sovetsk. Dal'nego Vostoka 1: 200. 1985.
BASIONYM: *Calamagrostis epigeios* (L.) Roth subsp. *extremiorientalis* Tzvel., Novosti Sist. Vyssh. Rast. 2: 40. 1965. *C. epigeios* (L.) Roth var. *extremiorientalis* (Tzvel.) Kitag., Neo-Lineam. Fl. Manshur.: 74. 1979.

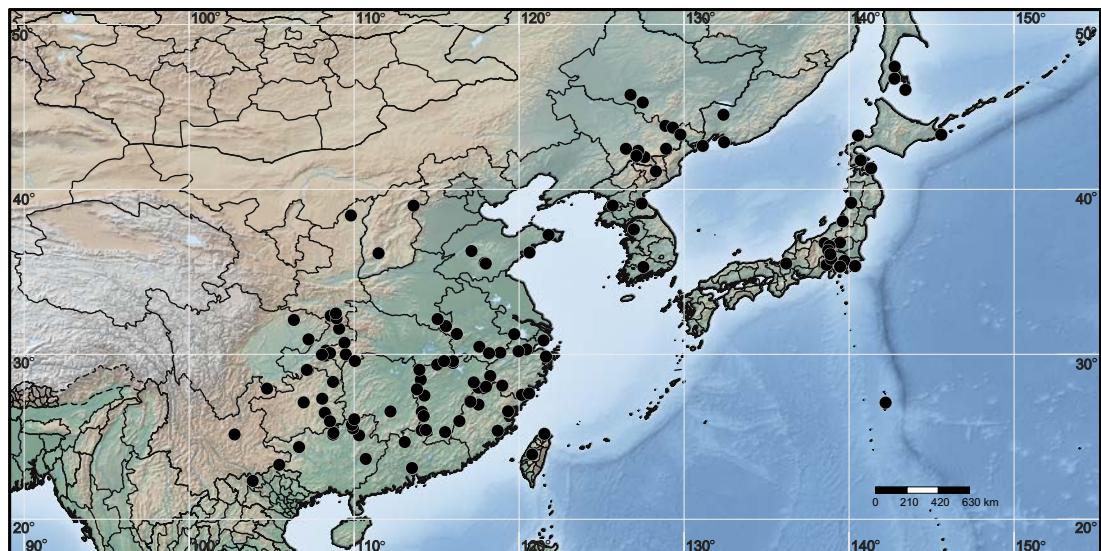

Fig. 2. General distribution of *Calamagrostis extremiorientalis* (Tzvel.) Prob.

TYPE: RUSSIA. [SAKHALIN OBLAST]. [Korsakovsky Distr.]: Yuzhn. Sakhalin (S Sakhalin), Anivskij zaliv [Aniva Bay], g. Aniva (Mt. Aniva), on sand dunes at seashore [46.036°N, 143.416°E], 12 Aug. 1948, M. Popov s.n. (HOLOTYPE, LE!).

Calamagrostis kengii T. F. Wang, Acta Phytotax. Sin. **10**: 312. 1965. TYPE: CHINA. HEILONGJIANG. [Ning'an City]: Shanchi (Shangzhi), Maorshan (Mao'ershian), the forest of NEFI [45.268°N, 127.495°E], 13 July 1961, Y. B. Chang (Y. B. Zhang) & G. J. Yin (G. Z. Ren) 3660 (HOLOTYPE, NEFI!). Synonymized by Paszko & Ma (2011).

Calamagrostis epigeios (L.) Roth var. *sylvatica* T. F. Wang, Acta Phytotax. Sin. **10**: 309. 1965. TYPE: CHINA. JILIN. [Changbai Korean Autonomous Co.]: Linkiang (Linjiang), S edge of Mt. Changbaishan [42.032°N, 127.116°E], 20 Aug. 1957, Y. L. Chou (Y. L. Zhou) 2442 (HOLOTYPE, NEFI!). Synonymized by Paszko & Ma (2011).

Calamagrostis elatior auct. non (Griseb.) A. Camus: Camus, Bull. Soc. Bot. France **75**: 555. 1928; Schmid, Agron. Trop. (Nogent-sur-Marne) **13**: 484. 1958; Khoi & Đỗ, Checkl. Pl. Spec. Vietnam **3**: 782. 2005.

Calamagrostis epigeios auct. non (L.) Roth (p.p.): Lu, Fl. Reipubl. Popularis Sin. **9**(3): 229. 1987; Lu & Phillips, Fl. China **22**: 360. 2006.

A reliable description of *C. extremiorientalis* was provided by Paszko and Ma (2011).

Calamagrostis elatior was recorded by Camus (1928) and subsequently by Schmid (1958) from Tonkin Province in Vietnam based on Petelot's collection no. 5080, housed at P. During the 18th and 19th centuries, westerners commonly used the name Tonkin (from *Dông Kinh*) to refer to northwestern Vietnam. The species was recorded from Sa Pa [the French called it Chapa], the tourist capital of northwestern, mountainous Vietnam, situated in the Tonkin Alps (Camus 1928; Schmid 1958). Morphological examination of this collection showed that these specimens belong to *C. extremiorientalis*, a species not previously recorded from Vietnam.

HABITAT AND PHENOLOGY. Perennial grass with long rhizomes. It occupies roadsides, uncultivated fields, grassy mountain slopes, riversides, open places in forests, sand dunes and swampy meadow at the seashore. 0–2000 m. Flowering June–August.

GENERAL DISTRIBUTION. China (Anhui, Chongqing, Fujian, Guangdong, Guangxi, Guizhou, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, S Shaanxi, Shandong, Shanghai, Shanxi, E Sichuan, Taiwan, E Yunnan, Zhejiang), Japan (Hokkaido, Honshu, Ogasawara Islands), North Korea (Kangwon, Pyongyang,

Ryanggang), Russia (Amur Oblast, Khabarovsk Krai, Primorsky Krai, S Sakhalin Oblast), South Korea (Jeolananam, Seoul), northwestern Vietnam (Lao Kay) (Fig. 2).

NOTES. *Calamagrostis epigeios* subsp. *extremiorientalis* was described by Tzvelev (1965: 40) on the basis of Popov's collection from the southern part of Sakhalin Island (Russian Far East). Tzvelev (1965, 1976) recorded it from the southern part of the Russian Far East (S Khabarovsk Krai, Primorsky Krai, S Sakhalin), Japan, the Korean Peninsula and northeastern China. Probatova (1985) provided a dot distribution map of *C. extremiorientalis* in the Russian Far East. She recorded *C. extremiorientalis* in Primorsky Krai and in the southern parts of the following subdivisions: Amur Oblast, Khabarovsk Krai, Sakhalin Island, Kuril Islands (Probatova 1985). The taxonomy of the *C. epigeios* complex in China was clarified by Paszko and Ma (2011) with the recognition of three species in China: *C. epigeios*, *C. extremiorientalis* and *C. macrolepis*. Paszko and Ma (2011) wrongly cited localities from Xuanen County within Hebei Province; Xuanen is a county of southwestern Hubei Province, China. As such, confirmed records of *C. extremiorientalis* from Hebei are lacking.

We here provide the first record of *C. extremiorientalis* from northwestern Vietnam and Japan's remote Bonin Islands (also known as the Ogasawara Islands). Its occurrence in Vietnam represents the southern limit of its known geographical range. No species of *Calamagrostis* is recorded in the Oceanic Islands Plant Specimen Database (Anonymous 2017), which was established to better understand the flora of the islands in Japan (Ohi-Toma *et al.* 2015).

3. *Calamagrostis tripilifera* Hook. f.

Fl. Brit. India 7(22): 262. 1897[1896].

BASIONYM: *Deyeuxia tripilifera* (Hook. f.) Keng, Sunyatsenia 6(1): 68. 1941. LECTOTYPE (designated by Paszko 2012: 341): INDIA. SIKKIM. [North Sikkim Distr.]: Himalaya, Tungu [Thangu] [alt. ca 3960 m] [27.898°N, 88.531°E], 1848, J. D. Hooker s.n. (LECTOTYPE K000098593!).

Deyeuxia flavens Keng, Sunyatsenia 6: 67. 1941. TYPE: CHINA. GANSU. [Xiahe Co.]: Labrang, collected on steppe [35.194°N, 102.504°E], 8 Oct. 1934, C. W. Yao 515 (p.p., mixed with *Poa sphondyloides* Trin. var. *maccerrima* Keng) (HOLOTYPE, IBSC, n.v.). Synonymized by Paszko (2012).

Agrostis triaristata auct. non Knapp: Khoi & Đô, Checkl. Pl. Spec. Vietnam 3: 782. 2005; Tran & Vu, Proc. 5th Nat. Scien. Conf. Ecol. & Biol. Res., Hanoi, 18 October 2013, 14. 2013.

Perennial, loosely tufted. Culms erect or geniculate at base, (13–)20–65(–88) cm tall, unbranched, glabrous; nodes 2–4. Sheaths smooth, not inflated; collars smooth; ligules 0.9–6.0 mm long, membranous, toothed. Cauline blades 2–13(–18) cm long, 1.8–5.3 mm wide, lanceolate-linear, green, flat; midrib not prominent; abaxial surfaces minutely scabrous; adaxial surfaces slightly ribbed, glabrous or minutely scabrid. Panicle open, very loose, 4.5–16.0(–22.5) cm long; branches usually paired, rarely in whorls of 3–4, distant, ascending or widely spreading, the lowest panicle branches 3.0–9.2 cm long; primary branches glabrous or rarely slightly scabrous, with spikelets clustered in upper half of branch. Spikelets 3.0–7.1 mm long, 1-flowered; glumes subequal, weakly scabrid on keel, acuminate at apex; the lower 3.0–7.1 mm long and 1.15–2.75 mm wide, 1-veined; the upper 2.75–6.40 mm long and 0.8–1.8 mm wide, 3-veined, 0.78–0.97 times as long as lower glume; callus hairs 0.65–1.75 mm long, 0.20–0.48 times as long as lemmas, surrounding the floret; lemma 2.7–5.5 mm long, 5-veined, 0.60–1.03 times as long as lower glumes, with dorsal awn 1.75–9.2 mm

long, geniculate with twisted column, attached usually on lower third [0.10–0.25(–0.41)] of lemmas, slightly exerted from glumes, lateral and intermediate veins prolonged into 0.20–0.85 mm long mucros with the outermost mucros longest; palea 1.85–3.80 mm long, 0.54–0.90 times as long as lemmas; rachilla extensions 0.3–1.25 mm long, densely bearded with hairs 1.5–3.0 mm long. Anthers 0.6–1.5 mm long. Flowering and fruiting in August and September.

Calamagrostis tripilifera was described by Hooker (1896) from Sikkim (NE India) based on three heterogenous elements. One of them (K000098593!), collected at Tungu (Thangu, N Sikkim), was designated by Paszko (2012) as lectotype. Hooker's *C. tripilifera* was incorrectly placed by Bor (1960) in synonymy with another species, *Agrostis triaristata* (Hook. f.) Bor, nom. illeg. hom. A recent taxonomic revision (Paszko 2012) revealed that *Deyeuxia triaristata* and *C. tripilifera* represent two different species, *C. tripilifera* and *C. filiformis* Griseb. (with *Deyeuxia triaristata* in synonymy with the latter). Paszko (2012) synonymized Chinese *Deyeuxia flavens* Keng within *C. tripilifera*. *Calamagrostis tripilifera* differs from *C. filiformis* by having shorter mucros at the lemma tip (0.20–0.85 vs. 0.90–1.75 mm long), broader lower glumes (1.15–2.75 vs. 0.9–1.5 mm wide), a higher ratio of lower glume width to lower glume length (0.25–0.51 vs. 0.19–0.32) and a lower ratio of upper to lower glume length (0.8–0.9 vs. 0.9–1.0) (Paszko 2012).

Paszko (2012) did not revise the Vietnamese collection of *C. tripilifera* recorded by Camus (1928) and subsequently by Schmid (1958). Our study confirms its correct identification made by Camus (1928), who recorded it from Mount Fan Si Pan (Fansipan), the highest point in Indochina (3143 m). Mount Fan Si Pan is situated on the border between Lai Chau and Lao Cai Provinces, 9 km southwest of Sa Pa, a Vietnamese mountain health resort.

HABITAT AND PHENOLOGY. Perennial, loosely tufted. *Calamagrostis tripilifera* occurs in subalpine and alpine meadows, grassy slopes, open woodlands or shrublands. 2700–4900 m. Flowering July–September.

GENERAL DISTRIBUTION. China (N Chongqing Municipality, Gansu, Sichuan, Qinghai, Xizang and Yunnan Provinces), India (N Sikkim Province) and NW Vietnam (Lao Kay Province) (Fig. 3).

NOTES. Most of the localities of *C. tripilifera* are in the eastern part of the Qinghai-Xizang (Tibetan) Plateau in China, where it is quite common in subalpine and alpine zones. It also has scattered localities in adjacent regions such as the Sikkim Himalayas (NE India), Daba Mts (Chongqing, Southwest China), Jiaozishan Mts (Yunnan, Southwest China) and Hoan Lien Son Mts (NW Vietnam), where it can occur occasionally in the subalpine and alpine zones of these mountains. *Calamagrostis tripilifera* ranges as far west as northern Sikkim (NE India) on the southern slopes of the Eastern Himalayas. It has also been recorded from the northern side of that range at a few scattered localities in adjacent parts of the Chinese Xizang Autonomous Region (Tibet), in Damxung and Mainling Counties. It is known from one locality in northern Vietnam. It was recorded there by Schmid (1958) from Mount Fan Si Pan. Its occurrence in northwestern Vietnam represents the southern limit of its known geographical range.

In *Flora of China*, Lu *et al.* (2006) recorded *Calamagrostis tripilifera* (as *Deyeuxia flavens*) only from Gansu, Qinghai, Sichuan, Xizang and Yunnan Provinces. Here we provide its first record from Chongqing Municipality, created on 14 March 1997; formerly it was part of Sichuan Province, China. *Calamagrostis tripilifera* was collected in the Hongchiba National Forest Park located in Wuxi County, in the Daba Mts region; the Daba Mts are part of the larger Qinling Range in the northern part of Chongqing Municipality. The occurrence of *C. tripilifera* in the Daba Mts represents the eastern limit of its known geographical range.

Tang* 1700 (PE); Chuanzhusi Town, Huang-chien-kuan (Huangshengguan), in mixed forest, alt. 3300 m [32.917°N, 103.583°E], 29 Aug. 1922, *H. Smith* 4059 (PE); Dongrergo [Hsioeh-pao-ting, Hsueh-po-ting], Huang-lung-ssii [Huanglongsi], alt. 4800–5000 m [32.583°N, 103.833°E], 21 July 1922, *H. Smith* 3288 (PE). Zoigê Co.: Leimanzhong, Yangfangqian, alt.

3440 m [33.579°N, 102.958°E], 4 Aug. 1975, s.c. 10352 (PE); Xiaman, Zhongyangfang, alt. 3440 m [33.579°N, 102.958°E], 4 Aug. 1975, s.c. 10352 (CDBI); Tangke, alt. 3440 m [33.579°N, 102.958°E], 8 Aug. 1975, s.c. 10376 (PE). XIZANG. Damxung Co.: Weiyuanduo [30.487°N, 91.099°E], 11 Aug. 1985, s.c. 3033 (PE). Jomda Co.: Ela Mt., among *Rhododendron* bushes, alt. 4320 m [31.506°N, 98.208°E], 26 Aug. 1976, *Qinghai-Tibetan Ecology Team* 9832 (PE). Mainling Co.: Pai Town, slope [29.214°N, 94.199°E], 17 Aug. 1981, *Qinghai-Tibetan Team* 1081 (PE). Qamdo Co.: Tuoba, alt. 3900–4000 m, grassland near *Picea* forest, alt. 3950 m [31.141°N, 97.172°E], 8 Aug. 1976, *Qinghai-Tibetan Team* 12653 (PE). Zayü Co.: Demula Mt., meadow, alt. 3000 m [28.675°N, 97.476°E], 29 Aug. 1976, Wu et al. 5212 (KUN). YUNNAN. Dêqên Co.: Baimang Mt., among alpine bushes, alt. 4200–4300 m [28.381°N, 98.99°E], 18 Aug. 1981, *Hengduan Mt. Team* 3293 (PE); 122 Road Class [28.489°N, 98.905°E], 24 Aug. 1981, B. S. Li s.n. (PE). Fugong Co.: Biluo Mt., Jiumingfang, under *Rhododendron* on slope, alt. 4200 m [26.47°N, 99.154°E], 14 Sept. 1964, S. K. Wu 8890 (KUN). Luquan Co.: Wumeng Town, top of Jiaozishan, on meadow or in rock crevice, alt. 4223 m, 26.157°N, 102.828°E, 3 Aug. 2008, H. Peng et al. 9427 (KUN); Wumeng Town, top of Jiaozishan, alpine meadow, alt. 4223 m, 26.157°N, 102.828°E, 3 Aug. 2008, H. Peng et al. 9444B (KUN). Shangri-La City: Haba Mt., under forest, alt. 2700 m [27.380°N, 100.115°E], 27 Sept. 2002, H. Y. Ma 119 (KUN).

VIETNAM. LAO KAY (LÀO CAI): Massif du Fan Tsi Pan [Phan Xi Păng, Fansipan], Chapu [Chapa, Sa Pá, Sapa], alt. 2900 m [22.303°N, 103.775°E], Aug. 1942, Petelot 7988 (P02651396, P03252805).

NOTES. Three species of *Calamagrostis* (*C. abnormis*, *C. extremiorientalis* and *C. tripilifera*) are recorded in the northwestern part of Vietnam. They are considered indigenous to this area. Their main distribution ranges are in China (Figs 1–3).

The geobotanical division of China and adjacent areas has not yet been settled, and various authors determine it differently. According to Chinese phytogeography, most regions of China are located within the Eastern Asiatic Floristic Kingdom, which can be further divided into three subkingdoms: (i) the Qinghai-Xizang (Tibetan) Plateau floristic subkingdom, (ii) the Sino-Himalayan Forest floristic subkingdom and (iii) the Sino-Japanese Forest floristic subkingdom (Wu & Wu 1998; Sun 2013).

The territory of Vietnam, lying northwest of the Song Hong River, represents the southern extension of the Himalayas (Averyanov *et al.* 2003). The other name of the Vietnamese Hoang Lien Son Range, part of the larger Ailao Shan Range, is the Tail of the Himalayas. Phytogeographically, according to Averyanov *et al.* (2003) the highland regions of the Vietnamese Lai Chau, Lao Cai and Yen Bai administrative provinces lie within the Sikang-Yunnan floristic province [= Sino-Himalayan Forest subkingdom of Wu and Wu (1998) and Sun (2013)]. The largest part of this province lies within China and includes the Eastern Himalayas, Hengduan Mt. and the Yunnan Plateau proposed by Wu and Wu (1998) in their preliminary floristic division of China. The Khasi-Manipur and northern Burma (N Myanmar) regions were omitted by Wu and Wu (1998), but they mentioned that according to Takhtajan's (1986) description they are also part of the Sino-Himalayan Forest subkingdom.

Considering the known distribution patterns of *C. abnormis*, *C. extremiorientalis* and *C. tripilifera* (Figs 1–3), they all are confined to the East Asiatic region. Three geographical elements can be recognized, because they are more or less restricted to one phytogeographical subregion. *Calamagrostis extremiorientalis* is confined to the Sino-Japanese subregion, *C. abnormis* to the Sino-Himalayan subregion, and *C. tripilifera* to the Qinghai-Xizang (Tibetan) Plateau subregion.

ACKNOWLEDGEMENTS. We are grateful to Dr. Jeffery M. Saarela (Canadian Museum of Nature, Ottawa) and Dr. Liu Su (Chenshan Botanical Garden, Shanghai) for helpful remarks and suggestions on the manuscript, and to the Curators of CAS, GH, KRAM, L, NEFI, TI and US for loans of their collections. Research visits of Beata Paszko to herbaria in Beijing (PE), Chengdu (CDBI), Kunming (KUN), Sankt Petersburg (LE) and Stockholm (S) were supported by the exchange programs between the Polish Academy of Sciences and counterpart National Academies, and to Edinburgh (E), London (BM, K), Paris (P) and Vienna (W) by SYNTHESYS Projects (grant nos. FR-TAF-6137, GB-TAF-2262, GB-TAF-4900, AT-TAF-6826) financed by the European Community Research Infrastructure Action under the FP7 'Capacities' Programme. This study was also financed in part from the statutory fund of the W. Szafer Institute of Botany of the Polish Academy of Sciences.
